Balancing Equations Worksheet 2 Answer Key: A Complete Guide

Learning to balance chemical equations is a cornerstone of high school chemistry and a critical skill for students preparing for college-level science courses. When students practice with worksheets, they develop the ability to apply the law of conservation of mass, identify reactants and products, and determine the correct stoichiometric coefficients. This article is centered on the **balancing equations worksheet 2 answer key**and provides a step by step walkthrough, practical tips, and additional resources to help students master the art of balancing equations.

Why Balancing Equations Matters

Balancing chemical equations is not just a classroom exercise; it reflects a fundamental principle of chemistry: atoms are neither created nor destroyed during a chemical reaction. The balanced equation represents a snapshot of the reaction where the number of atoms of each element is the same on both sides. This has real world implications in fields ranging from pharmaceuticals to environmental science, where precise stoichiometry determines safety, efficacy, and sustainability.

For students, mastering balancing equations opens the door to:

- Accurate calculations of reactant amounts and product yields.
- Better understanding of reaction mechanisms.
- Preparation for standardized tests such as the SAT, ACT, and AP Chemistry.
- Confidence in tackling more advanced topics like equilibrium, thermodynamics, and kinetics.

Common Strategies for Balancing Equations

Inspection Method

When the coefficients are small and the equation is straightforward, you can often balance it by simple inspection. This involves counting the number of atoms on each side and adjusting coefficients until they match.

Algebraic Method

For more complex reactions, especially those involving polyatomic ions or multiple products, the algebraic method is reliable. Assign variables to each coefficient, set up equations based on atom counts, and solve the system.

Coefficient First Approach

Start with the largest coefficient you can identify, such as the number of oxygen atoms in a combustion reaction. This reduces the number of variables and often leads to a quicker solution.

Check Your Work

After balancing, always double check every element. A common mistake is balancing one element while inadvertently unbalancing another.

Worksheet 2: Sample Problems

Below is a curated list of ten balancing problems that reflect the level of difficulty typically found in Worksheet 2. These problems cover a range of reaction types, including synthesis, decomposition, single replacement, double replacement, and combustion reactions.

1. Fe + O , !’ Fe ,O ƒ
2. Na + H ,O !’ NaOH + H ,
3. Al ,(SO „) ƒ + Ca(OH) , !’ Al(OH) ƒ + CaSO „
4. C ,H † + O , !’ CO , + H ,O
5. NH ƒ + O , !’ NO + H ,O
6. CaCl , + Na ,CO ƒ !’ CaCO ƒ + NaCl
7. H ,SO „ + NaOH !’ Na ,SO „ + H ,O
8. Mg + HCl !’ MgCl , + H ,
9. K ,SO „ + H ,O !’ KOH + H ,SO „
10. Zn + H ,SO „ !’ ZnSO „ + H ,

Balancing Equations Worksheet 2 Answer Key

Below is the answer key for the ten problems listed above. Each balanced equation is followed by a brief explanation of how the coefficients were determined.

1. Fe + O , !’ Fe ,O ƒ
   Balanced: 4 Fe + 3 O , !’ 2 Fe ,O ƒ
   Explanation: Two iron atoms are needed for one Fe ,O ƒ unit; therefore, 4 Fe atoms are required on the reactant side. Three O , molecules provide six oxygen atoms, matching the six in the product.
2. Na + H ,O !’ NaOH + H ,
   Balanced: 2 Na + 2 H ,O !’ 2 NaOH + H ,
   Explanation: Two sodium atoms balance the two sodium atoms in the hydroxide ions. Two water molecules supply four hydrogen atoms, which pair to form one H , molecule.
3. Al ,(SO „) ƒ + Ca(OH) , !’ Al(OH) ƒ + CaSO „
   Balanced: 2 Al ,(SO „) ƒ + 3 Ca(OH) , !’ 4 Al(OH) ƒ + 3 CaSO „
   Explanation: Two sulfate units on the left produce six sulfate ions, which are matched by three CaSO „ units on the right. The hydroxide ions are balanced by adjusting the calcium hydroxide coefficient.
4. C ,H † + O , !’ CO , + H ,O
   Balanced: C ,H † + 3.5 O , !’ 2 CO , + 3 H ,O
   Explanation: Using fractional coefficients is acceptable; however, multiply by 2 to eliminate fractions: 2 C ,H † + 7 O , !’ 4 CO , + 6 H ,O.
5. NH ƒ + O , !’ NO + H ,O
   Balanced: 4 NH ƒ + 5 O , !’ 4 NO + 6 H ,O
   Explanation: Four nitrogen atoms require four NO molecules; oxygen atoms are balanced by setting the O , coefficient to 5.
6. CaCl , + Na ,CO ƒ !’ CaCO ƒ + NaCl
   Balanced: CaCl , + Na ,CO ƒ !’ CaCO ƒ + 2 NaCl
   Explanation: One calcium chloride produces one calcium carbonate, and two sodium chloride molecules provide the needed chlorine atoms.
7. H ,SO „ + NaOH !’ Na ,SO „ + H ,O
   Balanced: H ,SO „ + 2 NaOH !’ Na ,SO „ + 2 H ,O
   Explanation: Two hydroxide ions are required to neutralize the two hydrogen atoms in sulfuric acid.
8. Mg + HCl !’ MgCl , + H ,

Balanced: Mg + 2 HCl !’ MgCl , + H ,

Explanation: Two chloride ions are needed for one magnesium ion; thus, two HCl molecules are necessary.

9. K ,SO „ + H ,O !’ KOH + H ,SO „

Balanced: K ,SO „ + 2 H ,O !’ 2 KOH + H ,SO „

Explanation: Two potassium atoms on the left produce two KOH molecules on the right; water provides the hydrogen atoms.

10. Zn + H ,SO „ !’ ZnSO „ + H ,

Balanced: Zn + H ,SO „ !’ ZnSO „ + H ,

Explanation: The reaction is already balanced; one zinc atom and one sulfate pair produce one zinc sulfate, while the two hydrogens form one H , molecule.

Step by Step Example: Balancing Fe + O , !’ Fe ,O ƒ

Let’s walk through the balancing process for the first problem in detail, demonstrating how the answer key was derived.

1. Write the unbalanced equation: Fe + O , !’ Fe ,O ƒ.
2. Count atoms on each side:

   Fe: 1 on the left, 2 on the right.
3. O: 2 on the left, 3 on the right.

- To balance Fe, place a coefficient of 4 in front of Fe on the left: 4 Fe + O , !’ Fe ,O ƒ.
- Now Fe is balanced (4 on each side).
- Fe ,O ƒ has 3 O atoms; to supply 3 O atoms from O ,, use a coefficient of 3/2 in front of O ,: 4 Fe + 3/2 O , !’ Fe ,O ƒ.
- To avoid fractions, multiply every coefficient by 2: 8 Fe + 3 O , !’ 2 Fe ,O ƒ.
- Fe: 8 on both sides.
- O: 6 on both sides (3 O , × 2 = 6).
