Step by Step Tutorial for Business Objects: A Complete Guide for Beginners and Professionals

In the fast moving world of data driven decision making, Business Objects (BO) remains one of the most powerful and versatile Business Intelligence (BI) suites available. Whether you're a data analyst, a BI developer, or a business manager looking to harness the full potential of your organization's data, mastering Business Objects is a strategic investment. This article offers a **step by step tutorial for Business Objects**, walking you through installation, data modeling, report creation, and deployment while incorporating SEO friendly best practices and real world tips.

Why Business Objects? Understanding the Value Proposition

Before diving into the technical details, it's helpful to grasp why many enterprises choose Business Objects over competing solutions. Key advantages include:

- Robust Data Connectivity – Connect to virtually any database, ERP system, or cloud source.
- Comprehensive Reporting Suite – From Web Intelligence (WebI) to Crystal Reports and Dashboards.
- Enterprise Grade Security – Fine grained access control and role based permissions.
- Scalable Architecture – Designed to support thousands of concurrent users.
- Extensible Platform – Custom plug ins, APIs, and integration with SAP and non SAP systems.

Prerequisites for the Tutorial

To follow this guide seamlessly, ensure you have the following:

- Access to a Business Objects installation (SAP BusinessObjects BI Platform).
- Administrator credentials for the BO Central Management Console (CMC).
- A data source (e.g., SQL Server, Oracle, SAP HANA) with sample data.
- Basic knowledge of SQL and relational database concepts.
- Microsoft Office suite (Excel, PowerPoint) for data preparation.

Step 1: Installing SAP BusinessObjects BI Platform

While many organizations use a pre installed package, here's a concise walkthrough for a fresh installation on Windows Server.

1. Download the Installer – Obtain the latest SAP BusinessObjects BI Platform installer from SAP Support Portal.
2. Run the Setup Wizard – Launch the installer and choose the "Complete" installation to include all components.
3. Configure the Repository – Create a new database schema for the BO repository (e.g., BO_REPO) and provide the necessary credentials.
4. Set Up the Web Server – Install the Web Server component and configure the port (default 8080).
5. Install the Central Management Console – This web based interface manages users, security, and content.

6. Finalize and Reboot – Complete the installation, reboot the server, and verify that the BO services are running.

Step 2: Configuring the Central Management Console (CMC)

The CMC is your command center. It allows you to create users, define groups, set security policies, and manage content.

1. Log In – Access the CMC at http://yourserver:8080/BOE/CMC using the admin credentials.
2. Create User Groups – Navigate to Users & Groups and create groups such as “Report Developers”, “Business Analysts”, and “Executives”.
3. Assign Permissions – Under Security, define object permissions (read, write, delete) for each group.
4. Set Up Data Sources – Go to Data Sources, add a new JDBC connection, and test connectivity.
5. Configure the Repository – Verify that the repository database is healthy and backup settings are in place.

Step 3: Building a Universe – The Data Model Layer

A Universe is the semantic layer that abstracts complex SQL queries into business friendly objects. It’s the foundation for all reports.

3.1 Create a New Universe

1. Open Universe Design Tool (UDT) – Launch the UDT client.
2. New Universe – Choose File > New > Universe, select the data source, and give your universe a meaningful name.
3. Add Tables – Drag and drop tables from the data source into the universe.
4. Define Joins – Establish relationships between tables using foreign keys.
5. Create Business Layer – Rename columns, define aliases, and set data types.
6. Apply Security Filters – Restrict data visibility based on user roles.
7. Validate and Save – Run the Validate tool to check for errors, then save the universe.

3.2 Publish the Universe to CMC

1. Export the Universe – In UDT, select File > Export and generate a .unv file.
2. Upload to CMC – In CMC, navigate to Universes, click Upload, and select the exported file.
3. Assign Permissions – Grant appropriate read/write rights to user groups.
4. Test Access – Log in as a non admin user and confirm the universe loads correctly.

Step 4: Creating Reports with Web Intelligence (WebI)

WebI is the flagship reporting tool in Business Objects, enabling interactive, ad hoc analysis.

4.1 Launch WebI

1. Open WebI – Navigate to http://yourserver:8080/BOE/BI and log in.
2. Create New Document – Click New > Web Intelligence Document, choose the universe, and proceed.
3. Insert Variables – Drag and drop dimensions (e.g., Product Category) and measures (e.g., Sales Amount) into the query panel.
4. Run the Query – Execute to fetch data.
5. Design the Report – Arrange objects in tables, charts, and pivot tables.
6. Apply Filters – Add slicers for date ranges, regions, or product lines.
7. Format and Style – Use themes, colors, and conditional formatting to enhance readability.
8. Save and Share – Save the document to the BO repository and publish to a folder accessible by target users.

4.2 Advanced WebI Techniques

- Calculated Variables – Create new metrics using formulas (e.g., Profit Margin = (Revenue - Cost) / Revenue).
- Dynamic Links – Embed hyperlinks that navigate to other documents or external URLs.
- Drill Down Capabilities – Enable users to click on a summary figure and view underlying details.
- Export Options – Export reports to PDF, Excel, or HTML for offline consumption.

Step 5: Building Dashboards with SAP BusinessObjects Dashboards

Dashboards provide a visual, real time view of KPIs. They are built using the SAP BO Dashboard Designer.

5.1 Set Up a Dashboard Project

1. Open Dashboard Designer – Launch the application from the SAP BO installation directory.
2. Create a New Project – Choose a name, specify the folder path, and add a data source.
3. Define Data Sets – Use SQL queries or the data source's semantic layer to fetch the required data.
4. Design the Layout – Drag widgets such as charts, tables, and KPI indicators onto the canvas.
5. Configure Interactivity – Add filters, drill through actions, and tooltips.
6. Apply Themes – Use pre built themes or create custom styles to match corporate branding.
7. Publish the Dashboard – Deploy to the BO Dashboard server and assign permissions.

5.2 Real Time Data Refresh

To keep dashboards current, schedule data refresh jobs via the BO Scheduler or integrate with SAP HANA Live for live data streaming.

Step 6: Automating Report Distribution with Scheduling

Automated distribution ensures stakeholders receive the latest insights without manual effort.

1. Open Scheduler – Access the BO Scheduler from CMC.
2. Create a New Job – Define the report or dashboard, set the frequency (daily, weekly, monthly), and choose the output format.
3. Define Recipients – Add email addresses or user groups.
4. Set Delivery Options – Attach reports as PDFs, Excel files, or send direct links.
5. Activate the Job – Turn on the schedule and monitor execution logs.

Step 7: Securing Your Business Objects Environment

Security is paramount. Follow these best practices to safeguard data:

- Role Based Access Control (RBAC) – Assign users to groups with the minimal necessary permissions.
- Data Level Security – Use universe filters to restrict data visibility per user.
- Audit Trails – Enable logging for report access, edits, and data exports.
- Encryption – Use HTTPS for web interfaces and TLS for database connections.
- Regular Updates – Patch BO components promptly to mitigate vulnerabilities.

Step 8: Troubleshooting Common Issues

Even seasoned users encounter hiccups. Here are quick fixes for frequent problems.

8.1 "Connection Refused" Errors

- Verify that the database listener is running and the firewall allows traffic.
- Check the JDBC URL syntax and credentials.

8.2 “Query Timeout” Issues

- Optimize SQL queries by adding indexes or rewriting joins.
- Increase the timeout setting in the BO data source configuration.

8.3 “Missing Data” in Reports

- Confirm that universe security filters are not inadvertently excluding data.
- Validate that the data source is up to date and that ETL processes are completing successfully.

Step 9: Extending Business Objects with APIs and SDKs

For developers, the BO SDK offers programmatic control over reports, users, and security.

- Java SDK – Automate report generation and export.
- SOAP Web Services – Interact with BO components from external applications.
- REST APIs – Leverage newer REST endpoints for lightweight integrations.

Best Practices for Sustainable BI with Business Objects

- Governance Framework – Establish data ownership, quality checks, and lifecycle management.
